Synopsis: Analytical Synopsis – Customer Decile Analysis

This project examines the customer base using **decile segmentation** to identify which groups contribute most to total profit and revenue. Customers were divided into ten equal segments based on their profitability, highlighting the difference between high-value and low-value clients.

The analysis reveals that **the top decile contributes nearly 40% of total profit**, showing that a relatively small group of highly active customers drives a large portion of the company's financial performance. In contrast, the bottom decile accounts for only around 1% of profit, indicating that many customers make infrequent or low-value purchases.

Quarterly metrics show that **customer activity varies between 6% and 16%**, with average revenue per active customer ranging from approximately $4,100 to $10,900. Average order value (AOV) and average order frequency (AOF) provide further insight into customer behavior and spending patterns.

From a managerial perspective, the results suggest prioritizing **retention of high-value customers**, while creating strategies to increase purchase frequency and order value among mid-tier customers. This decile analysis offers a clear view of customer value distribution, enabling better decision-making for **marketing investments, customer relationship management, and long-term profitability strategies**.
